New Zealand Threat Classification Series is a scientific monograph series presenting publications related to the New Zealand Threat Classification System (NZTCS). Most will be lists providing NZTCS status of members of a plant or animal group (e.g. algae, birds, spiders). There are currently 23 groups, each assessed once every 3 years. After each three-year cycle there will be a report analysing and summarising trends across all groups for that listing cycle. From time to time the manual that defines the categories, criteria and process for the NZTCS will be reviewed. Publications in this series are considered part of the formal international scientific literature.

This report is available from the departmental website in pdf form. Titles are listed in our catalogue on the website, refer www.doc.govt.nz under *Publications*, then *Series*.

Abstract

The conservation status of 154 New Zealand Hymenoptera taxa was reassessed using the New Zealand Threat Classification System (NZTCS). A full list is presented, along with a summary and brief notes on the most important changes. This list replaces all previous NZTCS lists for Hymenoptera.

Keywords: New Zealand Threat Classification System, NZTCS, conservation status, Apidae, Braconidae, Colletidae, Diapriidae, Encyrtidae, Ichneumonidae, Platygastridae.

1. Summary

The conservation status of 154 New Zealand Hymenoptera taxa and undescribed entities (hereafter collectively referred to as taxa) known to be present in New Zealand was assessed using the New Zealand Threat Classification System (NZTCS) criteria (Townsend et al. 2008). The status of the 69 taxa that were assessed in 2010 (Ward et al. 2012) has not changed in this 2014 assessment. However, two of the taxonomically indeterminate entities assessed in 2010 have since been described, and the identity of a third, *Leioproctus launcestonensis*, has been confirmed (Table 1). This 2014 assessment considers a further 82 taxa that were not assessed by Ward et al. (2012) (Table 2). Of these, 71 are listed as Data Deficient, 1 as At Risk—Naturally Uncommon, 2 as Not Threatened, 1 as Non-resident Native—Vagrant and 8 as Introduced and Naturalised (Tables 3, 4). We include a selection of Not Threatened, Non-Native (Vagrant and Introduced and Naturalised) taxa that were not included in Ward et al. (2012). Other Hymenoptera known to be in New Zealand (taxa listed by Macfarlane et al. (2010)) have not yet been formally assessed but are provisionally considered to be either Not Threatened or Introduced and Naturalised.

Table 1. Name change affecting New Zealand Hymenoptera between the assessment in 2010 (Ward et al. 2012) and this document.

TOTAL	154	47	1	2	2	18	1	1	82

2. Conservation status of New Zealand Hymenoptera

Taxa are assessed according to the criteria of Townsend et al. (2008), grouped by conservation status, then alphabetically by scientific name. Taxa are presented in two lists: taxonomically determinate (taxa that have been formally described and are accepted as valid, Table 5) and taxonomically indeterminate (formally described taxa whose taxonomic status is uncertain and requires further investigation, and also possibly distinct Hymenoptera whose taxonomic status has yet to be determined, Table 6).

The relevant assessment criteria and Qualifiers are also listed for each taxon. For non-endemic species that are threatened internationally, the IUCN category is listed alongside the NZTCS listing.

Categories are ordered by degree of loss, with Extinct at the top of the list and Not Threatened at the bottom, above Introduced and Naturalised. The Data Deficient list is inserted between Extinct and Threatened. Although the true status of Data Deficient taxa will span the entire range of available categories, taxa are in that list mainly because they are very seldom seen, so most are likely to end up being considered threatened and some may already be extinct. The Data Deficient list is likely to include many of the most threatened species in New Zealand.

Extinct

Taxa for which there is no reasonable doubt—following repeated surveys in known or expected habitats at appropriate times (diurnal, seasonal and annual) and throughout the taxon's historic range—that the last individual has died.

Taxonomically determinate: 0

Taxonomically indeterminate: 0

Data Deficient

Taxa that are suspected to be threatened or, in some instances, possibly extinct but are not definitely known to belong to any particular category due to a lack of current information about their distribution and abundance. It is hoped that listing such taxa will stimulate research to find out the true category (for a more detailed definition see Townsend et al. 2008).

Taxonomically determinate: 89

Taxonomically indeterminate: 29

Threatened

Taxa that meet the criteria specified by Townsend et al. (2008) for the categories Nationally Critical, Nationally Endangered and Nationally Vulnerable.

Nationally Critical

Criteria for Nationally Critical:

A—very small population (natural or unnatural)

A(1) <250 mature individuals, regardless of cause

A(2) ≤2 subpopulations, ≤200 mature individuals in the larger subpopulation

A(3) Total area of occupancy ≤1 ha (0.01 km²)

B—small population (natural or unnatural) with a high ongoing or predicted decline

- B(1/1) 250–1000 mature individuals, predicted decline 50–70%
- B(2/1) ≤5 subpopulations, ≤300 mature individuals in the largest subpopulation, predicted decline 50–70%
- B(3/1) Total area of occupancy ≤10 ha (0.1 km²), predicted decline 50–70%

C—population (irrespective of size or number of subpopulations) with a very high ongoing or predicted decline (>70%)

- C Predicted decline >70%
- Taxonomically determinate: 2
- Taxonomically indeterminate: 0

Nationally Endangered

Criteria for Nationally Endangered:

A—small population (natural or unnatural) that has a low to high ongoing or predicted decline

- A(1/1) 250–1000 mature individuals, predicted decline 10–50%
- A(2/1) ≤5 subpopulations, ≤300 mature individuals in the largest subpopulation, predicted decline 10–50%
- A(3/1) Total area of occupancy ≤10 ha (0.1 km²), predicted decline 10–50%

B—small stable population (unnatural)

- B(1/1) 250–1000 mature individuals, stable population
- B(2/1) ≤5 subpopulations, ≤300 mature individuals in the largest subpopulation, stable population
- B(3/1) Total area of occupancy ≤10 ha (0.1 km²), stable population

C—moderate population and high ongoing or predicted decline

- C(1/1) 1000–5000 mature individuals, predicted decline 50–70%
 - C(2/1) ≤15 subpopulations, ≤500 mature individuals in the largest subpopulation, predicted decline 50–70%
 - C(3/1) Total area of occupancy ≤100 ha (1 km²), predicted decline 50–70%
- Taxonomically determinate: 0
Taxonomically indeterminate: 0

Nationally Vulnerable

Criteria for Nationally Vulnerable:

A—small, increasing population (unnatural)

- A(1/1) 250–1000 mature individuals, predicted increase >10%
- A(2/1) ≤5 subpopulations, ≤300 mature individuals in the largest subpopulation, predicted increase >10%
- A(3/1) Total area of occupancy ≤10 ha (0.1 km²), predicted increase >10%

B—moderate, stable population (unnatural)

- B(1/1) 1000–5000 mature individuals, stable population
- B(2/1) ≤15 subpopulations, ≤500 mature individuals in the largest subpopulation, stable population
- B(3/1) Total area of occupancy ≤100 ha (1 km²), stable population

C—moderate population, with population trend that is declining

- C(1/1) 1000–5000 mature individuals, predicted decline 10–50%
- C(2/1) ≤15 subpopulations, ≤500 mature individuals in the largest subpopulation, predicted decline 10–50%
- C(3/1) Total area of occupancy ≤100 ha (1 km²), predicted decline 10–50%

D—moderate to large population, and moderate to high ongoing or predicted decline

- D(1/1) 5000–20 000 mature individuals, predicted decline 30–70%
- D(2/1) ≤15 subpopulations and ≤1000 mature individuals in the largest subpopulation, predicted decline 30–70%
- D(3/1) Total area of occupancy ≤1000 ha (10 km²), predicted decline 30–70%

E—large population, and high ongoing or predicted decline

- E(1/1) 20 000–100 000 mature individuals, predicted decline 50–70%
 - E(2/1) Total area of occupancy ≤10 000 ha (100 km²), predicted decline 50–70%
- Taxonomically determinate: o
Taxonomically indeterminate: o

At Risk

Taxa that meet the criteria specified by Townsend et al. (2008) for Declining, Recovering, Relict and Naturally Uncommon.

Declining

Criteria for Declining:

A—moderate to large population and low ongoing or predicted decline

- A(1/1) 5000–20 000 mature individuals, predicted decline 10–30%
- A(2/1) Total area of occupancy ≤1000 ha (10 km²), predicted decline 10–30%

B—large population and low to moderate ongoing or predicted decline

- B(1/1) 20 000–100 000 mature individuals, predicted decline 10–50%
- B(2/1) Total area of occupancy ≤10 000 ha (100 km²), predicted decline 10–50%

C—very large population and low to high ongoing or predicted decline

- C(1/1) >100 000 mature individuals, predicted decline 10–70%
- C(2/1) Total area of occupancy >10 000 ha (100 km²), predicted decline 10–70%

Taxonomically determinate: o

Taxonomically indeterminate: o

Recovering

Taxa that have undergone a documented decline within the last 1000 years and now have an ongoing or predicted increase of >10% in the total population or area of occupancy, taken over the next 10 years or three generations, whichever is longer. Note that such taxa that are increasing but have a population size of <1000 mature individuals (or total area of occupancy of <10 ha) are listed in one of the Threatened categories, depending on their population size (for more details see Townsend et al. (2008)).

Criteria for Recovering:

- A 1000–5000 mature individuals or total area of occupancy ≤100 ha (1 km²), and predicted increase >10%

B 5000–20 000 mature individuals or total area of occupancy \leq 1000 ha (10 km²), and predicted increase >10%

Taxonomically determinate: 0

Taxonomically indeterminate: 0

Relict

Taxa that have undergone a documented decline within the last 1000 years and now occupy <10% of their former range and meet one of the following criteria:

A 5000–20 000 mature individuals; population stable (\pm 10%)

B >20 000 mature individuals; population stable or increasing at >10%.

The range of a relictual taxon takes into account the area currently occupied as a ratio of its former extent. Relict can also include taxa that exist as reintroduced and self-sustaining populations within or outside their former known range (for more details see Townsend et al. 2008).

Taxonomically determinate: 0

Taxonomically indeterminate: 0

Naturally Uncommon

Taxa whose distribution is confined to a specific geographical area or which occur within naturally small and widely scattered populations, where this distribution is not the result of human disturbance.

Taxonomically determinate: 18

Taxonomically indeterminate: 3

Non-resident Native

Taxa whose natural presence in New Zealand is either discontinuous (Migrant) or sporadic or temporary (Vagrant) or which have succeeded in recently (since 1950) establishing a resident breeding population (Coloniser).

Migrant

Taxa that predictably and cyclically visit New Zealand as part of their normal life cycle (a minimum of 15 individuals known or presumed to visit per annum) but do not breed here.

Taxonomically determinate: 0

Taxonomically indeterminate: 0

Vagrant

Taxa whose occurrences, though natural, are sporadic and typically transitory, or migrants with fewer than 15 individuals visiting New Zealand per annum.

Taxonomically determinate: 0

Taxonomically indeterminate: 1

Coloniser

Taxa that otherwise trigger Threatened categories because of small population size, but have arrived in New Zealand without direct or indirect help from humans and have been successfully reproducing in the wild only since 1950.

Taxonomically determinate: 0

Taxonomically indeterminate: 0

Not Threatened

Resident native taxa that have large, stable populations.

Taxonomically determinate: 3

Taxonomically indeterminate: 0

Introduced and Naturalised

Taxa that have become naturalised in the wild after being deliberately or accidentally introduced into New Zealand by human agency.

Taxonomically determinate: 9

Taxonomically indeterminate: 0

Qualifiers

See Townsend et al. (2008) for details of criteria and qualifiers, which are abbreviated as follows:

CD Conservation Dependent

De Designated

DP Data Poor

EF Extreme Fluctuations

EW Extinct in the Wild

IE Island Endemic

Inc Increasing

OL One Location

PD Partial Decline

RF Recruitment Failure

RR Range Restricted

SO Secure Overseas

Sp Sparse

St Stable

TO Threatened Overseas
